

Use ONEAC protection for more profitable and reliable installations

An ONEAC Total Protection Solution cuts trouble calls in half.

ONEAC ensures that power disturbances do not disrupt telecom system performance. Field data confirms it. Leading installers who use ONEAC report more reliable voice, data and video communications, fewer damaged components to replace and far fewer service calls. As a result, these installers are able to assure customer satisfaction while increasing sales revenue and profitability on service contracts. Use ONEAC in your installations and you'll enjoy the same advantages.

Specifying ONEAC in your installations gives you more benefits...

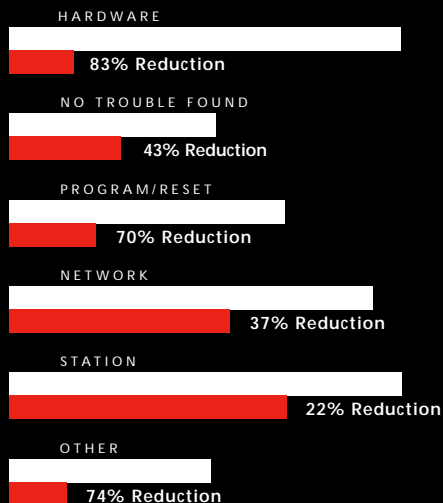

- **An edge over your competition.** Customers want suppliers who can reduce problems.
- **Fewer service calls!** Pocket the savings, or be more competitive when pricing service contracts.
- **Longer equipment life.** Especially important if you rent or lease equipment.
- **Increased sales revenue.** ONEAC's Total Protection Solution gives you an added source of profit.

And benefits your customers too.

- **Less downtime.** Saves them the cost of lost productivity or lost sales.
- **Increased system reliability.** Work flow is continuous, productivity higher, problems fewer.
- **Greater return on investment.** Because the telecom system they purchase will last longer.

AVERAGE REDUCTION IN TROUBLE CALLS

Better design means better protection

ONEAC offers features other telecom protection products can't match.

ONEAC communication line protectors.

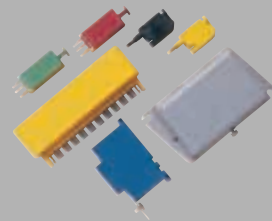

Transient voltages lower than desired signal voltages can be harmful at high frequency. Ordinary line protectors that clamp at a single voltage threshold can't stop them. ONEAC OnLine® protectors can. ONEAC protectors also last longer on the job. Their robust design better withstands repeated voltage surges. ONEAC also provides resettable sneak current protection — that saves you the downtime and cost of needless replacement due to nuisance fuse failures.

Surge protectors (TVSS) technologies pass through dangerous fast edged transients (left). ONEAC's power conditioning technology (right) eliminates them entirely.

Power conditioners & conditioned UPSs.

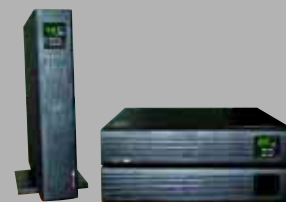

ONEAC power conditioners and conditioned UPSs provide higher level protection against lightning and other high voltage transients than conventional power protection products. They also eliminate all harmful high frequency transients — transients conventional products let through. The difference is in technology. Others use surge suppressors and filters. ONEAC employs a low impedance, isolating transformer with ONEAC's unique Virtual Kelvin Ground® technology. It's the one architecture with the proven ability to prevent all potentially damaging interference from entering the system.

ONEAC total protection means better value

Every installation needs protecting.

Contamination in communication and power lines is a fact of life. High voltage transients like lightning can shut down entire systems. High frequency disturbances caused by utility practices as well as copiers, elevators and other loads on building power lines can be equally devastating. You can't prevent harmful power disturbances from occurring. But by including an ONEAC Total Protection Solution with each installation, you'll prevent them from undermining the performance of your customers' systems.

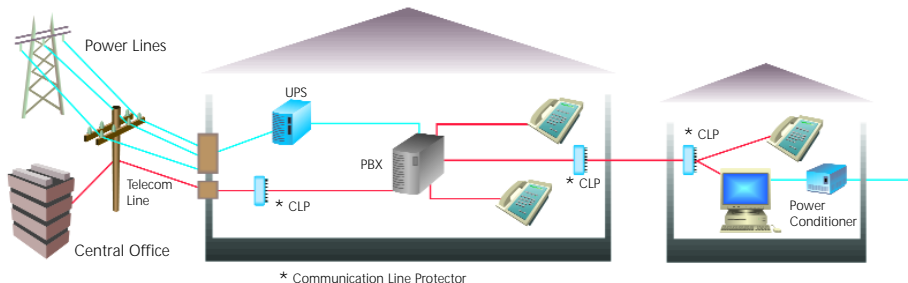

ONEAC, OnLine, and Virtual Kelvin Ground are registered trademarks of ONEAC Corporation. All other trademarks, product and corporate names are the property of their respective owners.

ONEAC is a UL/BSI registered firm — Certification Number A2900.

ONEAC saves your customers more money.

An ONEAC Total Protection Solution improves your customer's productivity by improving the reliability of their system. It also saves your customers (and you) the high expense of downtime and equipment failures. The added cost is small compared to the savings it provides. Explain that, and you'll find that ONEAC's Total Protection Solution is an easy sell.

ONEAC's Total Protection Solution protects all paths by which power disturbances can enter a system. Providing protection for communication lines (analog, digital or high speed data) and power protection with or without battery backup and communications interface software, the Total Protection Solution assures increased system reliability with far fewer interruptions or outages.
